

SMART WASTE MANAGEMENT SYSTEM FOR METROPOLITAN

ABSTRACT

TEAM ID: PNT2022TMID05191

With population growth and industrialization in every country, Waste has become a major concern for all of us around the world. Over years, researchers figured that only waste management is not only sufficient for proper disposal. Disposal techniques is needed to protect and keep the environment clean during this time of globalization. With the help of technology, researchers have introduced IoT Based on smart waste management solutions and initiatives that ensure reduction the amount of time and energy required to provide waste disposal services and reduce waste generation. Unfortunately, developing countries due to many factors make it impossible to implement these existing solutions, includes socio-economic environment. Therefore, in this study, we focused in Our idea to develop an intelligent IoT-based waste management system Proper disposal, collection, Minimize the transportation and recycling of household waste resource is available
